DEMOCRATIZATION OF SNEAKERBOTS

Sneakerbots, available in many forms and prices, are especially difficult to detect and stop. They hide behind residential proxy networks and motivated bot builders are highly incentivized to bypass defenses in order to get what they want.

MONITOR BOTS

Scans websites and searches for any information to determine when items will be dropped. Set an alert and feed info from these scanners into other bots such as AIO bots.

CHROME EXTENSIONS

A gateway into botting. Easy to install and easy to use. Sometimes free. Limited in-terms of the number of websites you can access and the inventory you'll be able to cop.

AIO BOTS

Designed for "all-in-one", these bots work across many websites and bulk checkouts. They bypass CAPTCHAs, login checks and can use Discord to inform of successful checkouts.

OPEN SOURCE

DIY by leveraging the collective knowledge of open-source. With an abundance of GitHub repos, scripts, stealth plugins and proxy networks – there's a bot for that to leverage.

SPECIALIZED BOTS

Optimized to score a specific type of sneakers, these bots actively update their methods to deal with an ever-evolving website and anti-bot detection methods.

BOTS AS A SERVICE

Why purchase a bot when you can rent one? Sit back in your Cook Group, wait for a drop, and create tasks for items you want. Or better yet, automate the entire process.
